

Product Summary

CloudNine Content Authoring System

In a nutshell...

CloudNine Content Authoring System (CAS) was built for internal use at Nine Lanterns. Originally conceived to maintain content we built for our clients it has evolved to become something more, a tool our clients' subject experts can use to create more...and more.

- It is a XML repository / server / content transformation engine
- Built on industry standards – XML, Schemas, XSLT, XQuery
- Architecture designed for multiple platform delivery
- Separates content from context

More...

Take your existing (or new) content, apply a learning model in the form of a series of templates – designed by you and Nine Lanterns together – and publish your own learning modules direct to your Learning Management System. Rapid eLearning development that is clean, efficient and effective.

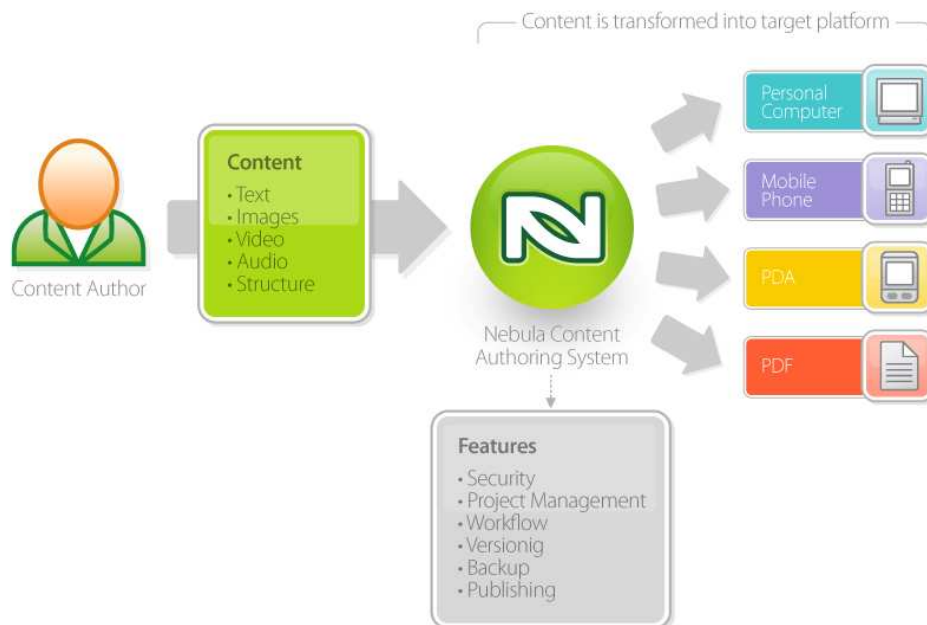

Use the same system to modify and maintain your eLearning.

Need to change some text to keep your compliance learning up-to-date with the latest legislation?

Easy. Do it yourself, edit the text and re-publish...instantly.

Do you need multiple versions of the same learning?

Perhaps as a classroom module, delivered by a trainer. An online course. Perhaps for a 3G mobile platform. Or a series of static, PDF documents. Easy. CloudNine CAS keeps your content separate from its presentation. Change the content at source and simply re-publish to your chosen platforms. Write once, publish many times to each platform with exactly the same content.

Product Summary

CloudNine Content Authoring System

Do you have content writers, instructional designers and your asset production in different parts of the company, maybe on different sides of the world?

Easy! CloudNine CAS provides a distributed workflow system, allowing multiple authors to work on your content all at the same time. The power of many hands and minds working together in itself is a beautiful thing to behold, not to mention the exemplary results it produces.

And your content is always kept up-to-date, and always published to SCORM conformant packages ready for delivery by your standards-based Learning Management System.

CloudNine CAS has been built from the ground up with real life production cycles in mind:

- A single media repository for all project data
- An integrated project management system
- Assign tasks
- Track bugs and issues
- Version control
- Keeps all versions of content
- Allows roll-back to previous versions
- Scalability
- Ability to run on multiple servers
- Separate physical locations for media rich production (e.g. local video media server)

The CloudNine CAS was built with one goal in mind, 'allow for more efficient and effective creation and modification of eLearning content'. And it delivers on that. In fact it performed so well we could not justify keeping it from our clients.

For more information please call for a demonstration. We will be more than happy to assist you in moving towards a new era, a new generation of eLearning creation that is based upon your need to get things done and at the time you need them.
